Magnetic Filtration Systems

High performance filtration systems for metalworking fluids, CNC machine tools and centralised fluid tanks.

Why Magnetic Filters?

Reduced expenditure on consumable filters

Significantly reduces consumption of disposable filtration media such as paper, bands, cartridges and socks, reducing expenditure and prioritising sustainability.

Cleaner, longer lasting fluids

Removes almost 100% of ferrous contamination, including sub-micron particles. This can extend the life of fluids and reduce growth of bacteria, minimising maintenance costs and enhancing safety.

Rapid return on investment

Magnetic filtration can be a driving force in cost reduction or continuous improvement programmes. They offer distinct cost saving benefits, resulting in a rapid return on investment, often within weeks.

Minimal running costs

No additional power or consumable parts are required for the day-to-day operation of manual systems. Automated filtration systems require a small amount of power but no consumable parts.

Continuous 24/7 operation

Ideal for large volume continuous processes. Once set up, they can run unmanned, without any need for stoppage or downtime.
